

I decided to create a relationship with the "customers" entity and the "tickets" entity where only one customer can purchase multiple tickets at a time up arriving at the movie theater or ordering online because movie theaters typically work by a customer-to-customer basis

The "tickets" and "movies" entities have a relationship where the number of tickets can go towards 1 or multiple films because you can buy a movie at one time and then purchase a ticket for a movie at another date.

The "concessions" and "customers" entites have a relationship where one ore more customers can order multiple types of concessions items. This way the concessions stands can operate with multiple customers at a time.
